BEAUTY SALON MARKETPLACE • MVC ARCHITECTURE V2.0

SuperXgen AI Startup Buildathon 2026

🚀 What's New in v2.0

We've completely upgraded the system workspace to bring an ultra-premium, interactive consumer feel. Here is what's fresh off the canvas:

Feature ✨	What it does! 🚀
Hero Slider	4-slide auto-switching carousel layout with tactile navigation arrows & indicators.
43 Live Salons	Individually populated with custom cover images, unique photo galleries, and 6+ services each.
Fixed Location Filters	Smart counters show the absolute correct number of operational outlets across Bangalore areas.
Luxury Login/Signup	Split-screen profile onboarding utilizing stylized glassmorphism aesthetics + password toggles.
Skeleton Shimmers	Eliminates flashing screens by applying smooth skeleton loaders while content async-loads.

🏠 Model-View-Controller (MVC) Directory Layout

The code architecture layout is clean, modular, and built explicitly to grow cleanly with zero structural friction:

```
src/  
├─ models/           ← Pure Data Schemas (SalonModel, Booking, User, Reviews)  
├─ controllers/      ← Business Logic hooks (Auth, Salon Management, AI Core)  
├─ services/  
│   ├─ firebase/     ← Initialization + authService & salonService  
│   └─ api/           ← aiService & local mock storage (43 Salons)
```

```

├─ views/
│  └─ components/
│     └─ layout/ ← Sticky Header Navbar & Unified Global Footer
│     └─ ui/      ← Reusable SalonCards, Carousel Sliders
│     └─ common/  ← Loading Spinners, Toast alerts, Private Route filters
├─ pages/         ← 12 main operational application views (Lazy-loaded!)
├─ utils/         ← Helper scripts & global constants
└─ App.jsx        ← Entry Route definitions wrapped in dynamic AuthProviders

```

Network Ecosystem (43 Salons across 12+ Areas)

From local luxury boutiques to national powerhouse beauty names, the directory counts map accurately across Bangalore:

Dev Config & Setup Environment

Quick Initialization

Get up and running immediately inside a localized testing setup by running:

```

npm install
npm start

```

*Works instantly out of the box using our preset local catalog—no initial configuration keys necessary!

Firestore & AI Connectivity

- ✎ To transition to production data sync tables, jump to `src/services/firebase/firebaseConfig.js` and configure keys.
- ✎ Flip the operational switch to live data fetching by altering `USE MOCK = false` inside your active salon service code layers.
- ✎ Power your automated **AI Stylist Finder** assistant engine by appending your keys to the project environment file:

```
REACT_APP_ANTHROPIC_API_KEY=your_claude_ai_key_here
```

💡 **Pro-Tip for Pitching:** Thanks to `React.lazy()` integration, components only download from the bundle package when a user routes to that specific screen, keeping initialization times incredibly fast for judge evaluations!
